# An Experiment in Cooking that Uses Degree Minutes 

by David W. Mawdsley

"In the United States, the mean $(\max +\mathrm{min}) / 2$ daily temperature in Fahrenheit and a temperature of 65 ${ }^{\circ} \mathrm{F}\left(18{ }^{\circ} \mathrm{C}\right)$ is used.

- If the mean daily temperature is $65^{\circ} \mathrm{F}$, no degree days are counted.
- If the mean daily temperature is below $65^{\circ} \mathrm{F}$, the mean degrees Fahrenheit below $65^{\circ} \mathrm{F}$ are counted as the heating degree day.
- If the mean daily temperature is above $65^{\circ} \mathrm{F}$, the mean degrees Fahrenheit above $65^{\circ} \mathrm{F}$ are counted as the cooling degree day.

The heating and cooling degree days are tallied separately to calculate monthly, seasonal, and yearly total heating and cooling degree days. Heating and cooling degree days closely correlate with heating and cooling demand. " (Excerpt source: https://en.wikipedia.org/wiki/Degree_day)

As an experiment I used degree minutes when I baked two different foods at the same time. From the packages of frozen food I discovered that when baking in an oven,
the codfish required $425^{\circ}$ for 27 minutes and
the crab cakes required $375^{\circ}$ for 17 minutes.

The codfish and crab cakes on a baking tray were both put in the oven at the same time at $375^{\circ}$.
After 17 minutes, I removed the cooked crab cakes and returned the codfish to continue cooking at $425^{\circ}$.

I used the following calculation to compute the remaining cooking time for the codfish:
$425^{\circ} * 27 \mathrm{~min} .=11475^{\circ} \mathrm{min} . \quad$ (cooking requirement for the codfish)
$375^{\circ} * 17 \mathrm{~min} .=6375^{\circ} \mathrm{min} . \quad$ (crab cakes fully cooked and removed from the oven)
$425^{\circ} * \mathrm{X}=5100^{\circ} \mathrm{min}$. (calculation for the codfish where $\mathrm{X}=$ the number of minutes remaining for the codfish to cook at $425^{\circ}$ )

Thus $\quad \mathrm{X}=5100^{\circ} \mathrm{min} . / 425^{\circ}$
$\mathrm{X}=12 \mathrm{~min}$. (remaining minutes to finish cooking the codfish)
The codfish cooked as expected. (Codfish cooking time of $17+12=29 \mathrm{~min}$. instead of 27 min .)
